

# 122 Series Siding Corners

122 Series Corners

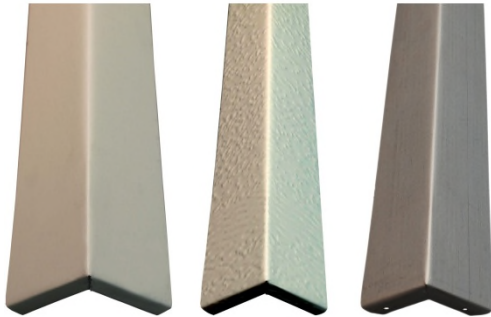

The **122 Series corners** are the industry standard corner for redwood and cedar siding. Constructed with a right angle flange, these corners come with nail holes for bottom nailing. The corners are available in a wide variety of lengths and flange widths to cover most styles of wood siding.

The **122 Series Bullnose corners** are a special corner designed to fit and complement 1/2" Rabbeted Bevel Siding Round Edge (Pattern #400). Using our Vintage style sculpted edge, these corners are the perfect complement to round out this very traditional craftsman style. These corners are constructed without nail holes.

122 Bullnose Pattern 400 Corner

## 122 Series Corner Textures

**S** Smooth      **WG** Wood Grain      **EG** Electrogalvanized

### MATERIAL NOTIFICATION FOR 122E

These corners are NOT galvanized for Rust Protection. The material used has either an EG (electrogalvanized) or Galvanneal coating for paint and stain bonding. The zinc layer provided by these processes is not sufficient to prevent rusting by itself. When using a latex based paint, the corners should be primed first with an appropriate corrosion resistant primer to avoid flash rusting. Simplicity Tool Corporation makes no express or implied warranty against rust when using this or any other product.
