

Vertical Grain & Rake Shake Siding Corners

Rake Shake (RS)

Vertical Grain (VG)

The 199 Vertical Grain Corners are designed using a vertically oriented open face grain texture designed to complement many modern shake style siding types. These corners have a full wraparound lip on the bottom and a nail hole at the top for easy and secure installation. The material is primed on the outside, and coated on the inside to inhibit corrosion.

The 199 Vertical Grain Prefinished Corners are available in all of the James Hardie ColorPlus® colors for the HardieShingle® Straight-Edge. Colors have been carefully developed and matched for both color and sheen.

The 199 Rake Shake Corners present a deep vertical pattern of straight lines, designed to fit siding styles that incorporate the combed or raked style. These corners have a full wraparound lip on the bottom and a nail hole at the top for easy and secure installation. The material is primed on the outside, and coated on the inside to inhibit corrosion.

121 Series Corners

The 121 Series corners are specifically designed for split shake or raked shake siding, with a straight vertical pattern to complement the grooved shake siding. These corners have a full wraparound lip on the bottom and nail holes at the top for easy and secure installation. The 121series corners are produced in both primed aluminum for applications that will be painted, or EG Steel for applications using stain.
